## Installation of a CAM (Conditional Access Module) in a Satellite Receiver with a CI (Common Interface) slot.

Many TV services are encrypted using a standard based encryption system for example Irdeto (as is commonly used in New Zealand)

The appropriate CAM is inserted into the receivers CI slot :

A CAM look like this:

A Viewing Card then needs to be inserted into the CAM with the contacts facing the thicker side of the CAM and inserted so they will be at the back.

The receiver will then with aid of the viewing card and CAM be able to decrypt the services that have been enabled for the viewing card.
