## Setting up a programmable RF modulator.

Many modern set top boxes do not have an integrated RF modulator but you may wish to use RF for a number of reasons e.g. you wish to locate the STB a long way from the TV, you wish to distribute the output of an STB to multiple TVs, you may wish to connect to the RF input of a TV because all the other inputs are used or installing cabling may be difficult.

The following example shows how to connect one STB to a TV.

It is important to select a UHF channel that is not already in use, you can select the UHF channel by pressing the + and – buttons on the front of the RF modulator. Once you have selected the desired channel press the SET button to save the setting.

You will then need to tune the TV in to the UHF channel you have selected.

Multiple RF Modulators can be used to send multiple UHF channels to one (or more, this is not shown in the example) TVs as is shown below:
